

Day 15

Redirection :-

There are three types of input/output redirections :

- 1) Standard input - 0
- 2) Standard output - 1
- 3) Standard error - 2

1) Standard input - 0 is for standard input
- Taking input normally refers to a user typing information from the keyboard. We use the less than sign for user input.

- The cat command can be used to record user input and save it to a file.

2) Standard output - 1 is for standard output.

- Output direction is handled with a greater than sign

- IO allows us to use redirection to control where the output goes.

3) Standard error - When using redirection we have to specify that error should be written to a file.

- 2 is for standard error.

- 2 > sign is used.
